Frequently Asked Questions

What is Water Filtration?

Water filtration is the process of removing impurities, contaminants, and harmful substances from water to make it safer for consumption. This can be done using physical barriers, chemical treatments, or biological processes to eliminate bacteria, sediments, and pollutants.

What is a Water Filtration System?

A water filtration system is a set of devices designed to filter and purify water by removing contaminants, chemicals, and particles. These systems range from simple filters for drinking water to comprehensive systems designed for entire homes or businesses.

What is the Best Water Filtration System for My Home or Business?

The best water filtration system depends on the specific contaminants in your water and your daily usage. A professional water test can help identify the ideal system—such as reverse osmosis, UV sterilization, or whole-house filtration—for your specific needs.

How Much Does a Home Water Filtration System Cost?

The cost of a water filtration system varies depending on the type, size, specific water issues, and installation requirements. Please contact us directly for a consultation and personalized quote.

What is a Reverse Osmosis (RO) Water Filtration System?

Reverse Osmosis is a water filtration method that removes up to 99% of contaminants, including bacteria, viruses, and harmful chemicals, by forcing water through a semi-permeable membrane. It's widely used for producing exceptionally clean drinking water.

What is a Whole House Water Filtration System?

A whole house water filtration system filters water as it enters your home, ensuring clean, safe water from every faucet. These systems typically use multiple filtration stages to eliminate sediments, chlorine, heavy metals, and other contaminants throughout the home.

How Often Should I Replace the Filters in My Water System?

The frequency of filter replacement depends on your specific system and local water quality. Typically, filters should be replaced every 3 to 12 months to maintain optimal performance. Refer to your product's guidelines or contact our technicians for advice.

Can I Install a Water Filtration System Myself?

While basic systems might be suitable for self-installation, we recommend professional installation for advanced systems like reverse osmosis and whole-house filtration, ensuring they function correctly and safely from the outset.

Are Your Water Filtration Systems Certified?

Yes, all Aqualife filtration systems meet stringent local and international safety and performance standards. Our products undergo rigorous testing and certification processes to ensure top quality and reliability.

What Maintenance Does My Water Filtration System Need?

Regular maintenance is essential and includes periodic filter replacements, system checks, and sanitization procedures. Our after-sales services provide comprehensive maintenance support to ensure your system stays efficient and reliable.

Do I Need a Water Softener Along with a Filtration System?

If your water contains high mineral levels (hard water), using a water softener alongside a filtration system can help prevent scale buildup in appliances and pipes, improve water taste, and protect your plumbing. Our team can help determine if a softener is necessary for you.

Is Reverse Osmosis (RO) Water Safe for Daily Drinking?

Absolutely. Reverse osmosis water is exceptionally pure, as it effectively removes nearly all contaminants, including bacteria, viruses, and harmful chemicals. Additionally, our RO systems feature an advanced remineralization process that reintroduces beneficial minerals back into the water, ensuring it's not just safe, but also healthier and better-tasting for daily drinking.
